L5 ANSWER 1 OF 14 BIOTECHDS COPYRIGHT 2003 THOMSON DERWENT AND ISI
 AB DERWENT ABSTRACT:
 NOVELTY - A variant (I) of a parent Termamyl-like alpha-amylase,
 comprising an alteration at one or more positions (P), having
 alpha-amylase activity, is new.
 DETAILED DESCRIPTION - (P) includes positions 49, 60, 104, 132, 161,
 170, 176, 180, 181, 183, 200, 203, 204, 207, 212, 237, 239, 250, 280,
 298, 318, 374, 385, 393, 402, 406, 427, 430, 440, 447 or 482. The
 alteration(s) are independently selected from an insertion at downstream
 position of the amino acid at (P), deletion of an amino acid at (P) or
 substitution of an amino acid at (P) with other amino acid, where each
 position corresponds to a position of the amino acid sequence of the
 parent Termamyl-like alpha-amylase comprising a sequence (S1) of 483
 amino acids fully defined in the specification. INDEPENDENT CLAIMS are
 also included for the following: (1) a DNA construct (II) comprising a
 DNA sequence encoding (I); (2) a recombinant expression vector (III)
 comprising (II); (3) a cell (IV) which is transformed with (II) or (III);
 (4) a composition (C) comprising (I); and (5) a detergent composition
 (DC) comprising (I).
 BIOTECHNOLOGY - Preferred Variant: (I) has one or more of the
 mutations given in the specification using S1 for the numbering. The
 parent Termamyl-like alpha-amylase is derived from a strain of Bacillus
 licheniformis (S1), B.amyloliquefaciens (comprising a sequence of 483
 amino acids fully defined in the specification) and B.stearothermophilus
 (comprising a sequence of 515 amino acids fully defined in the
 specification). The parent Termamyl-like alpha-amylase is selected from

SP690, SP722, AA560, 707 and alpha-amylase and KSM-AP1378 (all sequences comprising 485 amino acids fully defined in the specification). The parent alpha-amylase has at least 60%, preferably 90% identity to S1, and is encoded by a nucleic acid sequence which hybridizes under low, medium or high stringency conditions with a nucleic acid sequence comprising 1920 nucleotides fully defined in the specification. Preferred Cell: (IV) is a microorganism such as bacterium or **fungus**. The bacterium is *B.subtilis*, *B.licheniformis*, *B.lentus*, *B.brevis*, *B.stearothermophilus*, *B.alkalophilus*, *B.amyloliquefaciens*, *B.coagulans*, *B.circulans*, *B.lautus* or *B.thuringiensis*. Preferred Composition: (C) further comprises *B.stearothermophilus* (BSG) alpha-amylase in particular SP961, in a ratio of 1:10-10:1, preferably 1:2. (C) further comprises a glycoamylase, pullulanase and/or a phytase. DC further comprises protease, lipase, peroxidase, amylolytic enzyme glucoamylase, maltogenic amylase, CGTase, mannanase, **cutinase**, laccase and/or a cellulase. Preparation: The **variant** is prepared by standard genetic recombinant techniques.

USE - (I) is used for starch liquefaction, ethanol production, washing and/or dish washing, and textile desizing (claimed).

ADVANTAGE - (I) has altered stability in particular at high temperatures from 70-120degreesC and/or low pH in the range from pH 4.0-6.0.

EXAMPLE - To improve the stability at low pH and low calcium concentration of the parent *Bacillus licheniformis* alpha-amylase, error-prone polymerase chain reaction (PCR) mutagenesis was performed. The plasmid pDN1528 encoding wild-type *B.licheniformis* alpha-amylase gene was utilized as template to amplify the gene with primers, 22149 (5'-CGATTGCTGACGCTGTTATTTGCG-3') and 2814 (5'-GATCACCCGCGATACCGTC-3') under PCR conditions where increased error rates leads to introduction of random point mutations. The resultant PCR fragment was purified on gel and used in a PCR-based multimerization step with a gel purified vector fragment created by PCR amplification of pDN1528 with primers 24 (5'-GAATGTATGTGCGCCGGCAAAACGCCGGTGA-3') and 27 (5'-GCCGCCGCTGCTGCAGAATGAGGCAGCAAG-3') forming an overlap to the insert fragment. The multimerization reaction was subsequently introduced into *B.subtilis*. The error-prone library was screened in the low pH filter assay. Clones testing positive upon rescreening was submitted to secondary screening for stability in the liquid assay. (90 pages)

L5 ANSWER 8 OF 14 HCAPLUS COPYRIGHT 2003 ACS DUPLICATE 4

AB **Variants of fungal cutinases** have improved **thermostability**. The variants comprise substitution of one or more amino acid residues near the N-terminal in the amino acid sequence or in the three-dimensional structure of the cutinase. Thus, substitution mutants of *Humicola insolens* cutinase were prepd. These mutants displayed enhanced **thermostability**. The enzymes were used for removal of cyclic polyethyleneterephthalate from textiles, for textile dyeing, and for redn. of malodors on textiles.

L5 ANSWER 9 OF 14 BIOTECHDS COPYRIGHT 2003 THOMSON DERWENT AND ISI

AB A new **thermostable variant** (I) of a parent **fungal-cutinase** is claimed. (I) contains substitutions of one or more amino acid residues at a position (p) located within 17 angstrom or within 20 positions from the N-terminal amino acid. Also claimed are: a DNA sequence (II) encoding (I); a vector (III) containing (II); a transformed host cell harboring (II) or (III); a method for the preparation/construction of (I); a surfactant composition containing a surfactant and (I); and detecting cutinase activity in a sample, by incubating the sample with terephthalic acid bis(2-hydroxyethyl)ester dibenzoate and detecting hydrolysis of the ester. (I) is useful for dyeing polyester fabric or yarn. The method involves enzymatic hydrolysis at 65-75 deg, of a cyclic oligomer, e.g. cyclic tri(ethylene terephthalate) of poly(ethylene terephthalate) present in and on the fiber of polyester containing fabric or yarn. (I) is also useful for improving the functional finish of a polymer of ethyleneglycol and terephthalic acid containing yarn or fabric. (I) is useful in surfactant to improve the removal of fatty soiling and in baking industries, and paper making industries. (79pp)

L7 ANSWER 6 OF 24 BIOTECHDS COPYRIGHT 2003 THOMSON DERWENT AND ISI
AB Cutinase from Fusarium solani pisi was characterized in detail with respect to its structural and functional properties. The crystal structure of the enzyme was solved to high atomic resolution 1 Angstrom, while data n structural dynamics were obtained from detailed NMR studies. Functional data were mainly derived from kinetic studies using substrate analogs that simplify the kinetic behavior. The properties of wild-type cutinase are reviewed and discussed with respect to the effects brought about by site-directed **variants** of the enzyme.
Cutinase is an interesting enzyme that can be applied in a wide variety of systems ranging from surfactants to food and chemical industries. By enzyme engineering several of its drawbacks can be removed without affecting the desired traits of this versatile enzyme. (30 ref)

Primary Examiner—Nashaat T. Nashed**(74) Attorney, Agent, or Firm**—Elias J. Lambiris; Jason I. Garbell**(57) ABSTRACT**

The present invention relates to a modified enzyme with lipolytic activity, a lipolytic enzyme capable of removing a substantial amount of fatty matter a one cycle wash, a DNA sequence encoding said enzymes, a vector comprising said DNA sequence, a host cell harbouring said DNA sequence or said vector, and a process for producing said enzymes with lipolytic activity.
